GLOBAL SOLUTIONS FROM THE GROUND UP

CASHING IN ON SOIL HEALTH

July 17, 2009 9am-4pm

Healthy soil is the building block of vitality for plants, animals and humans. What's more, healthy soil can be our leading tool to fight global warming.

There's a clear "carbon connection" farmers can make between storing biological carbon in soils and removing carbon dioxide from the atmosphere. In the near future, farmers and landowners who farm in ways that increase their capacity for carbon sequestration can be financially rewarded for their efforts. That's right—extra income for using agriculturally sound practices that also build soil health.

Join Rodale Institute researchers and guest speakers on July 17 for a day of presentations, hands-on workshops and Institute farm tours.

DISCOVER

resources on how to start building soil health.

LEARN

soil-building practices that every farmer can use every day.

SEE

what 30 years of organic management does to improve soil texture and performance.

EXPERIENCE

the vitality of a farm that is actively pioneering the frontiers of organic agriculture after 60-years of ground-breaking research.

Fee: \$15.00 includes lunch
